E2B Documentation

```
export const Quickstart = () => {
  const items = [{
    href: "/docs/quickstart",
    title: "Running your first Sandbox",
    description: "Learn how to start your first E2B Sandbox with our Python or JavaScript SDK.",
    icon: "circle-play"
  }, {
    href: "/docs/quickstart/connect-llms",
    title: "Connecting LLMs to E2B",
    description: "Connect your favorite LLM to E2B to run AI-generated code inside the Sandbox.",
    icon: "brain-circuit"
  }, {
    href: "/docs/quickstart/upload-download-files",
    title: "Uploading & downloading files",
    description: "A quick guide on how to upload and download files to and from the Sandbox.",
    icon: "cloud-arrow-up"
  }, {
    href: "/docs/quickstart/install-custom-packages",
    title: "Install custom packages",
    description: "Customize your Sandbox with third-party packages.",
    icon: "box-open-full"
  }
  ];
  return <Columns cols={2}>
    {items.map(i => <Card title={i.title} href={i.href} icon={i.icon}>
      {i.description}
    </Card>)}
  </Columns>;
};
```

What is E2B?

E2B provides isolated sandboxes that let agents safely execute code, process data, and run tools. Our SDKs make it easy to start and manage these environments.

Start a sandbox and run code in a few lines:

```
<CodeGroup>
  ``bash JavaScript & TypeScript theme={"theme":{"light":"github-light","dark":"github-dark-default"}}
  npm i e2b
  ``
```

```
  ``bash Python theme={"theme":{"light":"github-light","dark":"github-dark-default"}}
  pip install e2b
  ``
```

```
</CodeGroup>
```

```
<CodeGroup>
  ``javascript JavaScript & TypeScript theme={"theme":{"light":"github-light","dark":"github-dark-default"}}
  import { Sandbox } from 'e2b'
```

```

  const sandbox = await Sandbox.create() // Needs E2B_API_KEY environment variable
  const result = await sandbox.commands.run('echo "Hello from E2B Sandbox!"')
  console.log(result.stdout)
  ``
```

```
  ``python Python theme={"theme":{"light":"github-light","dark":"github-dark-default"}}
  from e2b import Sandbox
```

```
sandbox = Sandbox.create() # Needs E2B_API_KEY environment variable
result = sandbox.commands.run('echo "Hello from E2B Sandbox!')
print(result.stdout)
````
```

</CodeGroup>

## ## E2B building blocks

A quick overview of the core building blocks you'll interact with when using E2B.

- \* **[\*\*Sandbox\*\*]**(/docs/sandbox) – A fast, secure Linux VM created on demand for your agent
- \* **[\*\*Template\*\*]**(/docs/template/quickstart) – Defines what environment a sandbox starts with

## ## How to use the docs

The documentation is split into three main sections:

- \* **[\*\*Quickstart\*\*]**(#quickstart) – Step-by-step tutorials that walk you through creating your first E2B sandboxes.
- \* **[\*\*Examples\*\*]**(#examples) – In-depth tutorials focused on specific use cases. Pick the topics that match what you're building.
- \* **[\*\*SDK Reference\*\*]**(https://e2b.dev/docs/sdk-reference) – A complete technical reference for every SDK method, parameter, and configuration option.

## ## Quickstart

<Quickstart />

## ## Examples

```
<CardGroup cols={2}>
 <Card title="Computer Use" icon="desktop" href="/docs/use-cases/computer-use">
 Build AI agents that see, understand, and control virtual Linux desktops using E2B
 Desktop sandboxes.
 </Card>

 <Card title="GitHub Actions CI/CD" icon="gears" href="/docs/use-cases/ci-cd">
 Use E2B sandboxes in your GitHub Actions workflows to run testing, validation, and AI
 code reviews.
 </Card>
